

AssuredMail

-  Video evidence to support a claim
-  Insurance premium protection
-  Mitigate risk, improve risk management
-  Assured Analysis telemetry software

AssuredMail delivers driver safety and protection information to you within seconds of an incident taking place. That may be a road collision, an unsafe braking/speeding event or where someone just feels unsafe and wants to know you're looking out for them. Using the latest 3G/4G technology a panic button press or G-Force trigger will automatically send an email notification to up to 5 email recipients. The emails will contain GPS position and a 10 second video file of the triggered event.

If the initial 10 second file shows an incident of interest, you can then request more footage and information from the camera. Receiving that information in seconds takes your ability to manage any potential claim to the next level. Industry statistics show that the faster any claim can be picked up and managed by your insurer (whether your fault or not) the cheaper the claim is to resolve. The lower the claim cost the less impact it has on your insurance renewal/loss ratio.

1. Camera installed

ASL1S is a windshield mounted device with an optional 2nd camera input. GPS, Accelerometer, Microphone, HD camera & 3G modem are all onboard

3. Images & drive data transmitted

AssuredMail server receives message from the ASL1S and pushes GPS/G-Force data and preview video file to user's e-mail address

2. Event triggered

A safety critical event occurs (accident, hard brake, overspeed, panic button, alarm input). ASL1S records HD video at full frame rate to its internal storage. At the same time, ASL1S transmits a preview file and e-mail message to AssuredMail server.

4. Video is instantly sent to users' inbox

User receives e-mail from AssuredMail server with 10 second preview video attached. User can request full resolution video by reply and review original file through the analysis tool.
